Rough Terrain Forklift

Used Rough Terrain Forklift Eugene - Forklift trucks utilize two forks to transport pallets and load and unload cargo. The rough terrain forklift and the industrial forklift are the two main types of forklift trucks. Industrial forklifts are mainly used in loading docks and warehouse applications with smooth and level surfaces. By contrast, the second category of forklifts, rough terrain forklifts, are commonly used to run on uneven and rocky surfaces. Rough terrain forklifts are often seen at construction sites and outdoors. They have the weight capacity, size and tires to handle heavy loads. The tire type is one of the key differences between rough terrain and industrial forklift units. Common road tires, cushion tires are the main kind found on industrial forklifts. Rough terrain forklifts, on the other hand, are fitted with pneumatic tires, a type of tractor tire allowing for better traction and flotation properties. Industrial forklifts are commonly powered by internal combustion engines although a fuel cell or battery electrical source may be used. Internal combustion engines are mainly used by rough terrain units. Types of Class 7 Rough Terrain Forklift Trucks There are three main types of Class 7 Rough Terrain Forklift Trucks: 1. Straight mast forklifts; 2. Telehandler forklifts; and 3. Rotating telehandler forklifts. Regardless of its type, all rough terrain forklift trucks are designed to handle, as their name suggests, natural rough terrain and disturbed rough terrain typical of construction and military sites. The rough terrain models travel and perform well in difficult locations. In the case of rough terrain forklift operations, extra consideration must be given while raising loads in these rough, variable conditions to prevent tip-over. For safety reasons, it is vital the forklift maintains stability before moving, lifting or lowering. Stability of ground and knowledge of proper lifting technique is essential for safe operation of rough terrain forklifts. Straight Mast Forklifts The straight mast forklift design enables easy transport around rough terrain locations including construction and demolition sites. Better accessibility and maneuverability are offered by these units thanks to their pneumatic cushion tires. These allow the forklift truck to easily travel over rough terrain on the worksite. It is common for straight mast forklifts to come with 2-wheel or 4-wheel drive. Most straight mast forklifts are powered by diesel or propane fuel, allowing them to be used indoors for short periods but are more suited to outdoor applications. Both standard and straight mast forklifts offer similar lifting capacities weighing from 5000 to 36,000 pounds, depending on the model. Telehandler or Telescopic Handler Forklifts Telehandler or telescopic handler forklift trucks are equipped with a telescoping boom, giving them their name. This specially designed boom allows the forklift truck to pick up loads and place them at differing heights in front of the unit. The operator can achieve enhanced flexibility with better reach during load placement. A standard telehandler forklift is long and low, with two wheels at the very front of the forklift and another pair of wheels toward the rear of the machine. Mounted at the back of the forklift, the telescopic boom is on a pivot that is located many feet above the forklift frame. The left side of the machine houses the cab and the hydraulic fluid tank and the fuel tank are found opposite to the cab. The forklift engine and transmission are situated along the center of the machine. Creating a balanced machine is essential for a well-designed forklift. Having this particular configuration generates a stable environment for lifting, lowering and transporting loads. Telehandler units offer significantly higher lifting heights compared to standard units. Also called compact telehandlers or high-reach telehandlers, these forklift trucks can lift their full load capacities from 18 feet, for the compact telehandlers, to 56 feet, for the high-reach telehandlers, into the air. Their load capacities usually range between 5,500 and 12,000 pounds. All-wheel steering is popular for all-terrain forklifts and provides increased maneuverability. The power-shift transmission and steering features allow the operator to move the forklift into a safe and successful working proximity. Recent telehandler units showcase top-of-the-line ergonomic design to generate increased comfort and operator satisfaction. These features include tilted steering options and roomier cabs to increase operator comfort. High in demand at job sites, these ergonomic options reduce operator fatigue and repetitive stress injuries. Most telehandler

forklifts rely on a single joystick. The joystick is essential for controlling the boom functions and the hydraulics responsible for forward operation. These machines can use non-marking tires to allow them to be suitable for maintenance in stadiums and on buildings or billboards and sign operations. Rotating Telehandler or Roto Telescopic Handler Forklifts Roto telescopic handler forklifts or rotating telehandlers have numerous items in common with the standard telehandler model. These include the rotating telehandler's ability to lift heavy weight to great heights. However, these forklifts have the added ability to rotate the forklift on a turntable. Rotating the forklift a complete three-hundred-and-sixty degrees creates a larger working location without the need of repositioning the forklift. Because of this additional feature, rotating telehandlers often have a second joystick to allow operation of the rotation function apart from the lift function. Power-assist steering minimized slip differential on the rear axle for additional traction and four-wheel drive are some of the extra features offered on rotating telehandlers and standard telehandler models. Of course, a machine that can rotate has extra safety considerations to understand. Rotating telehandler rough terrain models come with standard stabilizers to establish more safety while rotating loads back and forth. Certain rotating telehandlers operate without stabilizers; minimizing the time it takes to reposition the machine and move to other workplace locations. Rotator telehandler units are typically smaller than standard telehandlers with their fixed-cab design. Understandably, rotator telehandler machines can handler smaller load capacities compared to their standard telehandler counterparts. Rotating telehandlers offer load capacities ranging from 4000 to 10,000 lbs. and lift heights between fifteen to eighty feet. Both telehandlers and rotator telehandlers can be used as a crane when fitted with a winch attachment. This means that these forklifts can sometimes allow a project to forego the need for a crane at the jobsite, saving time, expense and workspace. Advancements for Rough Terrain Forklifts Many attachments are currently available for rough terrain forklifts, such as booms, winches, rotating fork carriages and articulating booms. Forklift attachments are vital for diversifying the machine. They will continue to be developed for years to come. However, the bulk of advancements are expected to be in the form of safety features, built-in to manufactured rough terrain forklifts. Automatic load restriction units and certain safety features have started being implemented. These systems automatically weigh a load and then calculate the safe reach distance of that load, taking into consideration the angle and extension of the boom. If the safe reach distance is reached, an alarm will sound, warning the operator to make the proper adjustments to either the boom angle, the reach distance or load weight.
